Nonalcoholic Fatty Liver Disease E Chart: Full Illustrated

Nonalcoholic Fatty Liver Disease

Nonalcoholic fatty liver disease is a disease of the liver that is characterized by an accumulation of fat and triglycerides within the liver cells. The liver stores excess fat from the diet, which normally is used and used during normal processes that are in the normal metabolism of the body. In cases of obesity, the liver can be overloaded with fat and triglycerides. This can lead to liver disease and eventually cirrhosis. There are two main types of fatty liver disease: nonalcoholic fatty liver disease (NAFLD) and nonalcoholic steatohepatitis (NASH). NAFLD is the most common form of liver disease, affecting about 25% of the population. NASH is a more severe form of liver disease, affecting about 5% of the population. Both conditions can lead to liver failure and cirrhosis if left untreated.

The most common cause of the disease is obesity, which is the fact that it is associated with insulin resistance, hyperlipidemia, and type 2 diabetes. The liver stores excess fat from the diet, which normally is used and used during normal processes that are in the normal metabolism of the body. In cases of obesity, the liver can be overloaded with fat and triglycerides. This can lead to liver disease and eventually cirrhosis. There are two main types of fatty liver disease: nonalcoholic fatty liver disease (NAFLD) and nonalcoholic steatohepatitis (NASH). NAFLD is the most common form of liver disease, affecting about 25% of the population. NASH is a more severe form of liver disease, affecting about 5% of the population. Both conditions can lead to liver failure and cirrhosis if left untreated.

Both factors, insulin resistance and hyperlipidemia, have been associated in animal models with obesity, insulin resistance, and hyperlipidemia. The most important ones being for following:

- Obesity
- Insulin resistance
- Hyperlipidemia

All these factors are related to insulin resistance, which is the cornerstone of the problem. The disease has also been linked to the genetic, mitochondrial, and epigenetic factors, and all of these factors contribute to the disease.

Normal liver, fatty liver and cirrhosis of the liver

Histology Normal liver

Histology Steatosis / Steatohepatitis

Histology Cirrhotic liver

Pathophysiology of fatty liver

Pharmacological treatment

Legend: Liver fat, Inflammation, Triglycerides
